

CODE CHALLENGE

Using the provided data (tickets.json and users.json and organization.json)

Write a simple command line application to search the data and return the results in a human readable format.

- Feel free to use libraries or roll your own code as you see fit.
- Where the data exists, values from any related entities **MUST** be included in the results, i.e.
 - Searching **organization** **MUST** return its **ticket subject** and **users name**
 - Searching **users** **MUST** return his/her **assignee ticket subject** and **submitted ticket subject** and his/her **organization name**
 - Searching **tickets** **MUST** return its **assignee name**, **submitter name**, and **organization name**.
- The user should be able to search on any field, full value matching is fine (e.g. "mar" won't return "mary").
- The user should also be able to search for empty values, e.g. where description is empty.
- Search can get pretty complicated pretty easily, we just want to see that you can code a basic search application.

EVALUATION CRITERIA (IMPORTANT)

We will look at your project and assess it for:

1. **Extensibility** - separation of concerns.
2. **Simplicity** - aim for the simplest solution that gets the job done whilst remaining readable, extensible and testable.
3. **Test Coverage** - breaking changes should break your tests. We prefer **Unit Test** without testing the json file, please **mock** them.
4. **Performance** - should gracefully handle a significant increase in amount of data provided (e.g 10000+ users).
5. **Robustness** - should handle and report errors. If you have any questions about this criteria please ask.

if you have any questions about this criteria please ask.

SPECIFICATIONS

- Include a README with (accurate) usage instructions.

SUBMISSION

Github is the preferred option (a public repo is fine) but we will also accept a .zip file if necessary. Email your solution to us.

HELP

We made a simple program and compile them into binary named as ‘**challenge**’, please feel free to run it and refer to it to see the expectation.

SAMPLE

Search

```
Type 'quit' to exit at any time, Press 'Enter' to continue
```

```
Select search options:
```

- * Press 1 to search
- * Press 2 to view a list of searchable fields
- * Type 'quit' to exit

```
